Otolaryngology professionals use the Rochester Nasal Septal Button™, the original product for non-surgical closure of septal perforations.

Inserted as an office procedure
Significantly reduces crusting and epistaxis
Closes perforations up to 25mm in diameter
Can be trimmed to the desired size

Additional product information on page 2 - photos on page 3
The septum is anesthetized with one or two cc of 5% Cocaine Solution or other topical anesthesia. Next, the size of the perforation is measured. This may be accomplished simply with a curette and marking pen. Using scissors, the button is then trimmed to a size which can be comfortably inserted and which will overlap the perforation.

The button is inserted into the nostril. One leaf of the button is folded and placed through the perforation. This can be accomplished by using a Hartman or ear alligator forceps. This leaf of the button is then grasped through the opposite nostril and gently pulled until the button is secured, closing the perforation.

Proper placement of the Septal Button can be tested by having the patient blow his or her nose. The Button should not be dislodged. If this does occur, adjustment may be necessary.

Refer to Otolaryngology - Head and Neck Surgery Article for documentation on the experiences of 73 patients.
